

Hintro Frontend Assignment

Problem Statement

Build a mock-dashboard for Hintro based on the figma design and using mock API's

Functional Requirements

- Follow the figma design end to end
 - Use the mock API's to for the data
 - The API doc suggest you to design for 2 users
 - One user would show empty data for empty states & other would have random data flowing on each API call (For details check the API doc)
 - Use global and consistent CSS themes, don't use hardcoded colors
 - Ensure responsiveness & clean transitions throughout the design
 - For the feedback functionality in sidebar, the design shows the detailed flow and it's expected to store those feedback in localStorage
 - The time and stats data from the API would be in seconds or whatever it is configured to, but the dashboard should exactly follow the conventions needed in the figma design
 - The UI must leverage the API's for data and not hardcode them
- Expected Deliverables

- Clean working UI, should match figma layouts
- Consistent theme, responsiveness & clean transitions
- 2 users and data being shown accordingly
- Show empty states for user 1 and filled states for user 2
- Handle time measurements according to the data and design

Nice to have

- A video link showcasing what you have made and your approach
- A deployment URL

Submission Instructions

- Push complete working code to a public GitHub repository
- Include a detailed README with setup and run instructions
- Mention tech stack, conventions and assumptions clearly
